It looks fine. As you are probably aware, there were low concentrations of methane in many of the trip, field and method blanks. Not totally surprising given the extremely high concentrations in some of the well samples. Since the methane trigger level is so high I think it is totally appropriate to raise the reporting limits and qualify low level hits as non-detects at the raised reporting limit.

Rich,

There is a comment in the verification report for SDG12067a that affects the data qualifiers. I respond to each of these with either a concurrence or by providing lab perspective input. Let us know if you have any comments or concern with the approach presented in the report.

Thanks,  
Cindy
